LECTURE - 27 (Recursion)

In recursion we try to solve a bigger problem by finding out solutions to smaller sub problems. We represent there ~~functions~~ problems in the form of functions and these functions calls itself to solve smaller sub problems.

PMI → Principal of Mathematical induction.

Q-1 Prove sum of first N natural no. is $\frac{N*(N+1)}{2}$

Base case → for N==1, ans. will be 1.
Assumption → Let's say formula valid for N=k ↑ $\frac{k*(k+1)}{2}$
self work → 1+2+3+----------+k + k+1

$\frac{k(k+1)}{2} + (k+1) \rightarrow (k+1)\left(\frac{k}{2}+1\right) \rightarrow \frac{(k+1)(k+2)}{2}$

Q-1 Write funct. for n!

Sol:
```
if(n==1)
{f(n)=1}
f(n) = n * f(n-1)
```

→ Base case: n==1 ? f(n)=1
→ assumption: f(n-1)
→ selfwork: Multiply n & f(n-1)

```
int f(int n){
    if(n==1)
        return 1;
    int ans = n * f(n-1);
    return ans;
}
int main(){
    int result = f(5)
    cout << result;
    return 0;
}
```

O(n) [Time and Space complexity]

{Space gets introduced} { due to call stack }

[50:00] Debugging

⇒ Working of Recursive function

- Syntax

```
methodName (N Parameters){
        if (Halting condition){ } Base case
            return result
        }
        return methodName (N parameters)
}
```

smaller sub Problem

Assumption + self work

Q1 Sol

nth fibonacci no.

```
int fib(int n){
    if (n==0 or n==1) return n;
    return fib(n-1) + fib(n-2);
}
int main(){
    int result = fib(5);
    cout << result;
    return 0;
}
```

space → O(n)

Time → $O(2^n)$

LECTURE-28

(Problems-1 on Recursion)

Q) Given an integer, find out the sum of its digits using recursion.

Ans

⇒ Base case → if(n≥0 and n≤9) return n;

⇒ Self Work's Recursively go and calc. sum of d-1 digits & add the last digit to it.

⇒ Assumption:- $f(n) = f(n/10) + n\%10$

↳ $f(n/10)$ works correctly.

Ans

```
int f(int n){
    if(n≥0 and n≤9) return n;
    return f(n/10) + (n%10);
}
int main(){
    int result = f(1234)
    cout<<result;
} return 0;
}
```

Q) Given two nos. p and q, find the value p^q using a recursive function.

Ans ⇒ # Base case → if(q==0) return 1;

Assumption → $f(p,q) = p * f(p,q-1)$ → return

```
int main(){
    int result = f(3,4)
    cout<<result;
```

O(q)

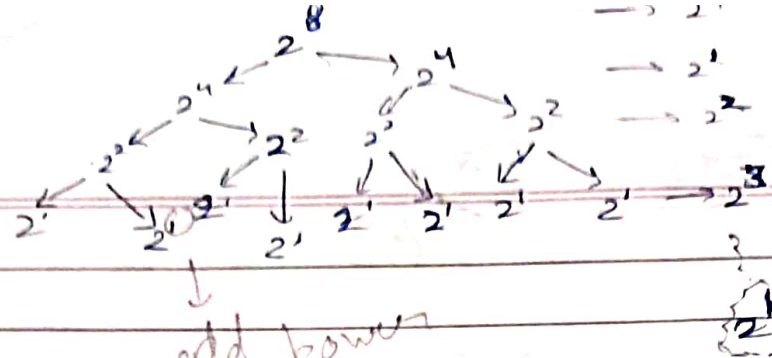
{Time complexity & Space}

FREEMIND

Date

Page

Method 2



$\frac{q}{2^0} \to \frac{q}{2} \to \frac{q}{2^2} \to \frac{q}{2^3} \cdots \cdots \cdots \frac{q}{2^k} \to 1$

$2^{16} \to (2^8)^2 \to (2^4)^2 \to (2^2)^2 \to (2)^2$

$q = 2^k$

$k = \log_2 q$

$f(p,q) \to \left(f\left(p, \frac{q}{2}\right)\right)^2$ $\quad q \to$ even

$f(p,q) \to p * \left(f\left(p, \frac{q}{2}\right)\right)^2$ $\quad q \to$ odd

$O(\log q)$ Time complexity

Code ⇒

```
#include <iostream>
using namespace std;
int f(int p, int q){
    if (q==0) return 1;
    if (q%2==0){
        int result = f(p, q/2);
        return result * result;
    }else{
        int result = f(p, q/2);
        return p * result * result;
    }
int main(){
    int res = f(5, 6);
    cout << res;
}

Lecture 29

(Problem on Recursion-2)

→ Recursion on arrays
→ Recursion on strings

f(arr, idx, n) ---→ length of array
↳ current idx we are pointing to in the array
given array

Q) Given an array, print all the elements of the array recursively.

A **Base case** → if array is empty print nothing

Assumption → f(arr, idx+1, n)

Self Work → print the element at the current index

Before you go to print remaining array, I can print myself

f(arr, idx, n) → print(arr[idx]) →
↓
f(arr, idx+1, n) → assume that we can correctly print the remaining array using f

#Code

```
void f(int *arr, int idx, int n){
    if(idx == n) return; // base case
    cout << arr[idx] << "\n"; // self Work
    f(arr, idx+1, n); // assume it work properly
}
int main(){
    int n=5;
    int arr[] = {6,1,9,3,4}
    f(arr, 0, n);
    return 0;
}
```

O(n) → Time
→ Space

FREEMIND

Date

Page

Q> Print the max value of the array [3, 10, 3, 2, 5].

Base case:- If array has only one element that is the max.
→ (idx == n-1) → return arr[idx]

Assumption :- we assume → f works correctly for f(arr, idx+1, n)
i.e. it successfully finds out max in the remaining array.

Self Work :- Compare the max. of remaining array with current array.

f(arr, idx, n) = max(arr[idx], f(arr, idx+1, n))

Code

```
int f(int *arr, int idx, int n)
{
    if (idx == n-1)
        return arr[idx];          // Base Case
    return max(arr[idx], f(arr, idx+1, n));   // Self Work + Assumption
}
int main() {
    int arr[5] = {3, 10, 3, 2, 5};
    int n = 5;
    cout << f(arr, 0, n);
    return 0;
}
```

Q> Find the sum of the values of the array [2, 3, 5, 20]

Base case, Assumption, self work same as prev. ques. (max → sum)

```
int f(int * arr, int idx, int n)
    if (idx == n-1) {
        return arr[idx];
    } return [arr idx + f(arr, idx+1, n)];
}
int main() {
    int arr[] = {2,3,5,20,1};
    int n = 5;
    cout << f(arr, 0, n);
    return 0;
}
```

LECTURE -30

(Recursion Problems - 3)

Q: Remove all occurrences of 'a' from strings s = "abcax".

Iteratively.

```
result = " "
for (i=0, i<n; i++) {
    if (S[i] != a) {
        result += S[i]
    }
}
```

Recursively

Base case → empty string (no char. remains)
↳ return empty string

assumption → f(arr, idx+1, n) → gives a string without 'a'.

Self work → if my current char is not 'a' append it with f(arr, idx+1, n)
else don't.

Note
S: Substring :-
Phle element ko remove karke uske sub part p work krta hai or aise hi last element tak work krta hai

FREEMIND

Date

$f(s, idx, n) = ((s[idx] == 'a')\ ?\ "" : s[idx]) + f(s, idx+1, n)$

Code

```
string f(string &s, int idx, int n) {
    if (idx == n) return "";
    string curr = "";
    curr += s[idx];
    return ((s[idx] == 'a' ? "" : curr) + f(s, idx+1, n));
}
int main() {
    string s = "abcax";
    int n = 5;
    cout << f(s, 0, n);
    return 0;
}
```

Q) Write a Program to check whether a given no. is palindrome or not.

$f(num, *temp) = f(num/10, temp)$ and $(num\%10 == temp\%10)$

$*temp = *temp/10$

? → true/false result

```
bool f(int num, int *temp) {
    if (num >= 0 and num <= 9) { lastdigitoftemp = (*temp)%10;
        (*temp) /= 10;
        return (num == lastdigitoftemp);
    }bool result = (f(num/10, temp) and (num%10) == ((*temp)%10));
    (*temp)/=10;
    return result;
}
int main() {
```

1261 → 1261
126 → 1261
12 → 1261
(1) → 1261

Date

Page

```
int main(){
    int num = 12621;
    int another num = num;
    int *temp = &anothernum;
    cout<<f(num, temp);
    return 0;
}
```

LECTURE-31

(Recursion Problem-4)

Q→ Given a no. n. Find the increasing sequence from 1 to n without using any loop.

Constraint: $0 < n < 1e6$

input: 4

output: 1234

$f(n) = f(n-1) \longrightarrow print(n)$

Base case → if(n<1) { return; }

Assumption → f(n-1) gives no. from 1 to n-1

Self Work → print(n) in f(n)

```
Void f(int n){
    if(n<1) return; // base case
    f(n-1)  // go and print first n-1 natural no. → assumption
    cout<<n<<" ";
}
int main(){
    f(20)
    return 0;
}
```

Date
Page

Q1 Given a number num and a value K. Print K multiples of num.
constraints: K>0
input: num = 12, K = 5
output: 12, 24, 36, 48, 60

Ans) num = 3, K = 5 → 3, 6 9 12 15

f(num, K) = f(num, K-1) → print(num*K)

Print first K multiples of n — assumption — selfwork

Base case (K==0) → we do nothing & just return

Code

```
Void f(int num, int k)
    if (K==0) return; // Base case
    f(num, k-1); //assumption → correctly prints K-1 terms
    Cout << num*k << " "; //Self Work
}
int main(){
    f(3,5)
}
```

Q2 Given a no. n. Find the sum of natural no.s till n but with alternate signs.
Ex:- if n=5 → return 1-2+3-4+5 = 3
constraints: 0 <= n <= 10^6
input: n=16
output -5

logic →

f(n) = f(n-1) + ((n%2==0)?(-n):n)

Base case (n→0) → return 0

FREEMIND

Date

Page

Ans> int f(int n){
if(n==0) return 0; //base case
return f(n-1) + ((n%2==0)?(-n):n); //assumption
//Calculate sum of 1st (n-1) natural no. with alternate signs, and we add n acc. to sign.
}

int main(){
cout<<f(10)<<"\n";
return 0;
}

LECTURE-32

(Recursion Problem - 5)

Q> Given two no.s x and y. Find the greatest common divisor of x and y using recursion. gcd/hcf

constraints: 0<=x,y<=1e6

input: x=4, y=9
output: 1

input: x=12, y=20
output: 4

12 → 2×2×3
20 → 2×2×5

Euclid's Algo.

If we sub. a smaller no. from a larger one. (we can reduce the large no.) but the gcd will not change.

Eg. gcd → 72, 54 → G
54, 72-54 → G
↳ 18

54 = 2×3×3×3
72 = 2×2×2×3×3
GCD ↳ 18

OR

54, 072%54
↳ 18

54 = 2×3×3×3
18 = 2×3×3
GCD ↳ 18
